

Predicting Memory Demands of BDD Operations using Maximum Graph Cuts

Steffan Christ Sølvesten and Jaco van de Pol

ATVA 2023

—○— BuDDy —◆— CUDD —■— Sylvan —●— Adiar v1.0

Running Time to solve N -Queens problems.

—○— BuDDy —◆— CUDD —□— Sylvan —●— Adiar v1.0

Running Time to solve N -Queens problems.

Running Time to solve N -Queens problems.

Running Time to solve N -Queens problems.

i -level cut

i -level cut

Lemma (Sølvsten, Van de Pol 2023)
The maximum i -level cut problem is in P for $i \in \{1, 2\}$.

Theorem (Lampis, Kaouri, Mitsou 2011)
The maximum i -level cut problem is NP-complete for $i \geq 4$.

Theorem (Sølvsten, Van de Pol 2023)

Given maximum 2-level cuts size C_f for f and C_g for g , the maximum 2-level cut for $f \odot g$ is less than or equal to $C_f \cdot C_g$.

Proof.

□

Theorem (Sølvsten, Van de Pol 2023)

Given maximum 2-level cuts size C_f for f and C_g for g , the maximum 2-level cut for $f \odot g$ is less than or equal to $C_f \cdot C_g$.

Proof.

□

Lemma (Sølvsten, Van de Pol 2023)

The maximum 2-level cut for f is at most $\frac{3}{2}$ larger than its maximum 1-level cut.

Proof.

□

Lemma (Sølvsten, Van de Pol 2023)

The maximum 2-level cut for f is at most $\frac{3}{2}$ larger than its maximum 1-level cut.

Proof.

□

Lemma (Sølvsten, Van de Pol 2023)

The maximum 2-level cut for f is at most $\frac{3}{2}$ larger than its maximum 1-level cut.

Proof.

□

1-level cut : 1.0%
2-level cut : 3.3%

Computational overhead of piggybacking i -level cut within Adiar.

Possible to process a

1.1 GiB BDD

with only

128 MiB Memory

Adiar v1.0 : 56.5 hours

Running time to verify the 15 smallest EPFL instances.

Adiar v1.0 : 56.5 hours

Adiar v1.2 : 4.0 hours (-93%)¹

Running time to verify the 15 smallest EPFL instances.

¹ 52.1 of these hours were saved on just verifying the `sin` circuit alone.

📖 ssoelvsten.github.io/adiar

					
	Sufficient?	Overhead	Memory	Disk R/W	Transition Cost
DF \triangleright Adiar 1.0	✗	$2\times$	–	–	–
DF \rightarrow Adiar 1.0	✗ ¹	–	–	–	$\Omega(N \log N)$
DF \triangleright Adiar ( \triangleright )	✗	$2\times$	–	$2N$	–
DF \parallel Adiar ( \parallel )	✓	$c_{M/3}$ ²	$M/3$	$2N$	–
State Pattern ( \rightarrow )	✓ ⁴	$c_{M/2}$ ² + $\sim 20\%$ ³	$M/2$	–	$\Omega(N)$
<i>i</i> -level cut ( / )	✓ ⁴	1%	–	–	–

Comparison of possible solutions.

¹There can be a gap between when depth-first runs out of memory and Adiar 1.0 has no overhead.

²Decreasing the memory dedicated to an external memory data structure impacts its performance.

³Runtime Polymorphism adds a 20% to 30% overhead [Stroustrup].

⁴This solves the gap¹; a *non-trivial* integration with depth-first algorithms can cover tiny cases.
