Aggarwal and Vitter '87

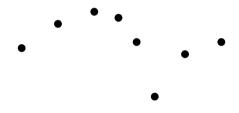

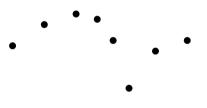

Theorem N elements can be sorted in $\Theta(N/B \cdot \log_{M/B}(N/B))$ I/Os.

Convex Hull

Compute the *convex hull* for N points in the plane.

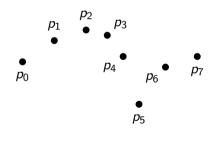

Theorem Convex Hull can be computed in $O(N/B \cdot \log_{M/B}(N/B))$ I/Os.

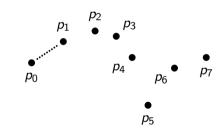

Upper Hull:

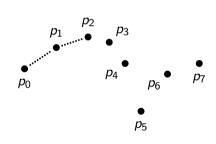

■ Sort input points by x-axis

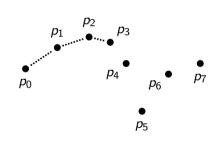

- Sort input points by x-axis
- Initialize stack $S = [p_0, p_1]$

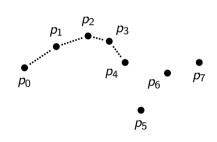

- Sort input points by x-axis
- Initialize stack $S = [p_0, p_1]$
- For remaining points $p_i \in p_2, p_3, \dots, p_{N-1}$:
 - 1 Let p_s , p_t be the two top-most points of S
 - 2 While $p_s p_t p_i$ is a "left-turn":
 - Pop p_t and go-to 1
 - 3 Push p_i onto S

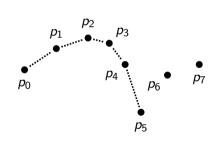

- Sort input points by x-axis
- Initialize stack $S = [p_0, p_1]$
- For remaining points $p_i \in p_2, p_3, \dots, p_{N-1}$:
 - 1 Let p_s , p_t be the two top-most points of S
 - 2 While $p_s p_t p_i$ is a "left-turn":
 - Pop p_t and go-to 1
 - 3 Push p_i onto S

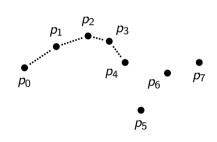

- Sort input points by x-axis
- Initialize stack $S = [p_0, p_1]$
- For remaining points $p_i \in p_2, p_3, \dots, p_{N-1}$:
 - 1 Let p_s , p_t be the two top-most points of S
 - 2 While $p_s p_t p_i$ is a "left-turn":
 - Pop p_t and go-to 1
 - 3 Push p_i onto S

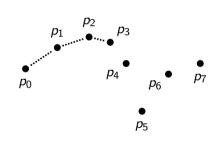

- Sort input points by x-axis
- Initialize stack $S = [p_0, p_1]$
- For remaining points $p_i \in p_2, p_3, \dots, p_{N-1}$:
 - 1 Let p_s , p_t be the two top-most points of S

Theorem

A Buffer Tree can resolve N inserts and deletes in $\Theta(N/B \cdot \log_{M/B}(N/B))$ I/Os.

Theorem

A Buffer Tree can resolve N inserts and deletes in $\Theta(N/B \cdot \log_{M/B}(N/B))$ I/Os.

Theorem

A Buffer Tree with N requests can empty all its buffers, and output all remaining sorted elements, in $\Theta(N/B)$ I/Os.

Theorem

A Buffer Tree can resolve N inserts and deletes in $\Theta(N/B \cdot \log_{M/B}(N/B))$ I/Os.

Theorem

A Buffer Tree with N requests can empty all its buffers, and output all remaining sorted elements, in $\Theta(N/B)$ I/Os.

Corollary

An I/O-efficient Priority Queue can resolve N push and deletemin operations in $\Theta(N/B \cdot \log_{M/B}(N/B))$ I/Os.

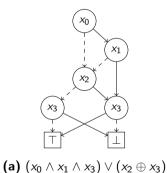

Proof.

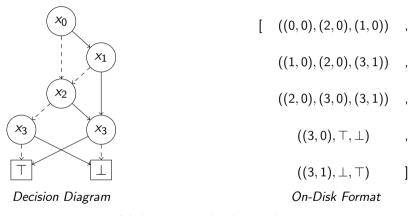

Use an M/2 sized internal memory priority queue, pq. If pq overflows, move M/4 the largest elements to a Buffer Tree, t. If pq underflows, obtain the M/4 smallest elements from t.

#Paths

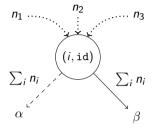

Given a Binary Decision Diagram of N nodes, compute the number of paths from the root to the \top terminal.

Theorem #Paths can be computed in $O(N/B \cdot \log_{M/B}(N/B))$ I/Os.

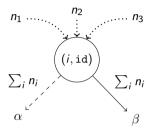

(a) $(x_0 \land x_1 \land x_3) \lor (x_2 \oplus x_3)$

Idea

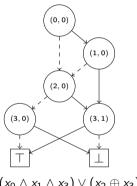

Count the number of in-going paths to each node.

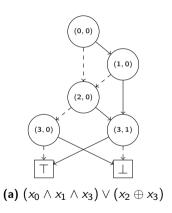

Time-Forward Processing

Defer work with Q_{count} : PriorityQueue $\langle (s \to t, \mathbb{N}) \rangle$ sorted on t in ascending order.

$$((i, \mathtt{id}) \xrightarrow{\perp} \alpha, \quad \sum_i n_i), \qquad ((i, \mathtt{id}) \xrightarrow{\top} \beta, \quad \sum_i n_i)$$

Batched Range Searching

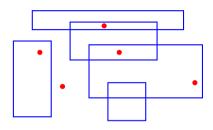

Given N axis-parallel rectangles and N points in the plane, compute for each point p all rectangles containing p.

Theorem

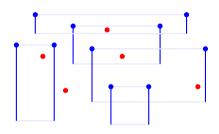

Batched Range Searching can be solved in O(sort(N) + scan(T)) I/Os.

Preprocessing:

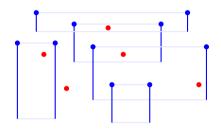

Preprocessing:

■ Split each rectangle into two vertical lines.

Preprocessing:

- Split each rectangle into two vertical lines.
- Sort all lines and points by their *x*-value.

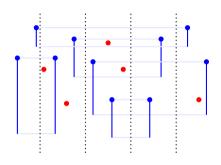

Preprocessing:

- Split each rectangle into two vertical lines.
- Sort all lines and points by their *x*-value.

Algorithm:

■ Split all data into $\Theta(\sqrt{M/B})$ slabs. Solve these recursively; output is given sorted by y-value.

Preprocessing:

- Split each rectangle into two vertical lines.
- Sort all lines and points by their *x*-value.

- Split all data into $\Theta(\sqrt{M/B})$ slabs. Solve these recursively; output is given sorted by *y*-value.
- Merge slabs together, report points between line segments outside its slab.
 - Use $\Theta(\sqrt{M/B}^2) = \Theta(\sqrt{M/B})$ multi-slabs to maintain each *active* rectangle.
 - Output points and un-matched line segments.
